

Keeping your pets healthy through the last days of summer. September 2026

A NOTE FROM Our Team

Welcome to the first edition of our newsletter! We'll be sharing hospital news, pet care tips, and special offers to help keep your pets happy and healthy.

As summer winds down and the autumn breeze starts to roll in, we want to help you and your pets finish the season strong. Thank you for trusting us with your pet's care. We appreciate being part of their health journey.

-Angel Animal Hospital Team

With the arrival of fall, September can bring a surge in seasonal allergies for pets. Changing weather patterns and rising levels of late-summer weed pollen can trigger allergy symptoms, making early fall an important time to watch for signs of environmental allergies.

LATE-SUMMER TRIGGERS to look out for

- Weed Pollen**
Late-blooming weeds such as sagebrush can cause intense reactions.
- Outdoor mold**
Damp soil, decaying leaves, and high humidity promote mold spore growth.
- Ragweed**
Releases lightweight pollen that travels long distances
- Dust Mites**
Populations rise indoors as windows close and weather cools

WATCH OUT FOR THESE SYMPTOMS

- Constant scratching, biting, or licking at paws, belly, and ears
- Red, inflamed skin or hot spots.
- Chronic or recurring ear infections

PROTECT YOUR PETS

- WIPE PAWS**
Clean your pet with a damp cloth or pet wipe after outdoor walks.
- LIMIT OUTDOOR TIME**
Keep pets inside during dry, windy days when pollen counts peak.
- BATHE REGULARLY**
Use a gentle, hypoallergenic or medicated shampoo to wash allergens from their fur
- CLEAN THE HOME**
Vacuum frequently and use air purifiers to trap indoor dust and spores

ARE YOUR PET'S VACCINATIONS UP TO DATE?

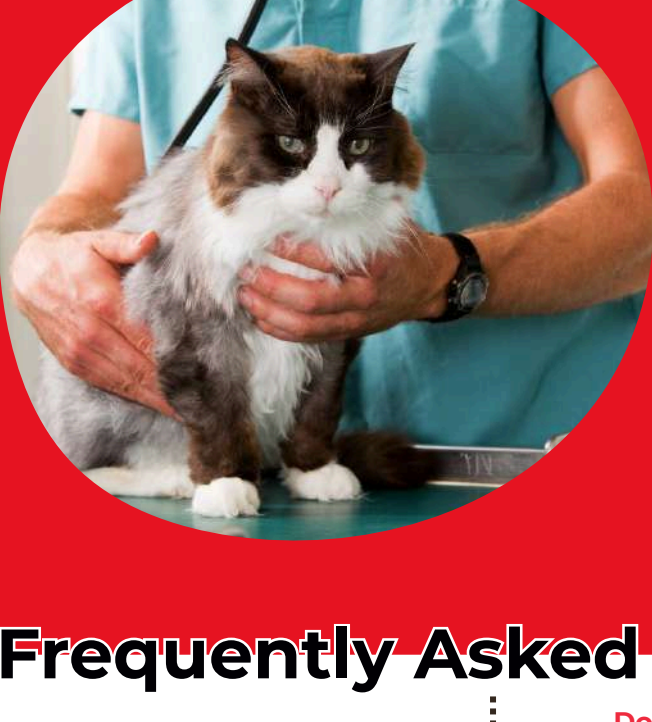

Vaccinations are not just a requirement, but also a tool that helps your fur babies strengthen their immune system and protect them against deadly viral and bacterial diseases.

- Core Vaccines for Dogs

 - ✓ Canine Rabies Vaccine
 - ✓ DA2PPV Vaccine
Protects against common canine diseases.
 - ✓ Leptospirosis Vaccine
- Core Vaccines for Cats

 - ✓ Feline Rabies Vaccine
 - ✓ FVRCP Vaccine
Protects against major feline respiratory and viral diseases.

What is a PREVENTIVE CARE EXAM?

A routine wellness exam is one of the best ways to keep your pet healthy!

During a nose-to-tail exam, your veterinarian carefully evaluates your pet's overall health by checking:

- Temperature
- Heart rate & respiration
- Weight
- Teeth & gums
- Eyes & ears
- Skin & coat
- Joints & mobility

Frequently Asked Questions:

How often should I bring my pet in for a check up?

We recommend having your pet seen every 6 months because they age much faster than we do. Regular checkups can help detect diseases and health concerns early.

Does my pet need vaccinations even if they are an indoor pet?

Yes! Even indoor pets still need vaccinations. Germs and viruses can make their way into your home through open windows, your shoes and clothes, or even if your pet sneaks outside for a little adventure. Keeping their vaccinations up to date helps give them an extra layer of protection.

My pet looks fine. Do they still need a checkup?

Yes, your pet still needs a checkup. Animals hide pain and sickness very well and they cannot tell you if they hurt or feel sick inside. Regular exams find hidden problems early before they get worse

WHY PREVENTIVES MATTER

Preventives protect your pet from invisible threats. A single bite from a flea, tick, or mosquito can transmit germs that can lead to severe illness, lifelong conditions, or costly emergency care. Routine preventives are the easiest and most effective way to keep your dog or cat safe from external and intestinal parasites.

Don't wait for symptoms to appear.

Ask us for the best prevention plan for your pet.

BIOFEEDBACK SCANS

Look beyond regular lab work

Every pet is unique—and their therapeutic needs are, too. Our integrative approach looks beyond individual symptoms to support the body as a whole.

Biofeedback scanning is a non-invasive assessment used as part of a personalized treatment plan. Your pet's body has its own unique frequency patterns, which will help us identify areas of physiologic stress and guide supportive, frequency-based therapies tailored to your pet.

A whole-body approach. A more personalized path to wellness.

Whole Body Detoxification

Detoxification is an important part of supporting your pet's overall wellness and healing. As the body processes and eliminates metabolic waste and other unwanted cellular material, some pets may experience temporary changes as part of the body's response.

We use a personalized combination of therapeutic modalities to support the body's natural detoxification processes while helping minimize discomfort. Our goal is to reduce physiologic stress, support the body's natural recovery processes, and promote whole-body wellness.

- Reduce overall physiological burden
- Supports healthy cellular function and recovery
- Supports the body's natural pathways in detoxification
- Supports balance and wellness
- Eliminates metabolic waste
